

INTEGRATION OF MULTIPLE OPENSTACK CLOUDS WITH A CORE MPLS NETWORK

WHO ARE WE?

Curtis Collicutt

- OpenStack Architect
- Interdynamix
- curtis@interdynamix.com

Rahul Kumar

- Sr. Network Engineer
- Interdynamix
- rahul@interdynamix.com

FRONT MATTER

- Standing on shoulders of giants
 - All the people work on OpenStack other open source systems
 - BGP-VPN/Bagpipe presentations and discussions
 - People who create networking labs and publish them
 - People who write books on MPLS, eg. "MPLS in the SDN Era"
- Perspective From an **OpenStack Operators** perspective, how do we:
 - Integrate a large number of OpenStack deployments with a SP-like MPLS WAN
 - Automate networking
 - Participate in modern networking paradigms, ie. NFV, network slicing, SDN...
 - Simulate these systems in some capacity to understand them better
 - \circ Investigate and observe their operation

Idx Idx LABS MPLS - MULTIPROTOCOL LABEL SWITCHING - WHY?

- Omnipresence Many devices understand MPLS
 - Including vswitches
- Has aged gracefully Well understood, interoperable implementations, standards based
- Scales reasonably
- Large % of mobile traffic crosses an MPLS network at some point
 - Also used by non-telecoms
- Protocol neutral
- Supports Traffic Engineering
 - RSVP-TE Resource Reservation Protocol with Traffic Engineering
- Fast reroute

- MPLS as a paradigm vs MPLS as an encapsulation
 - "MPLS is not an encapsulation. It is an architectural framework..."
- Decoupling:
 - control plane from data/forwarding plan
 - \circ service from transport
 - \circ overlay from underlay
- Layered architecture with a feature-rich edge and a fast transport core. This approach can be applied to the WAN, to data centers, and so on.
- Building overlay networks at the edge in order to support multitenancy and multiservice
- Minimizing the forwarding state in the core
- Advanced packet steering by either signaling forwarding paths and/or by stacking instructions on packet headers

V

V

As the guy who led twitter's backbone team I can categorically tell you that your Twitter traffic is all in labels for the majority of their journey

10:35 AM - 22 Apr 2018 from San Francisco, CA

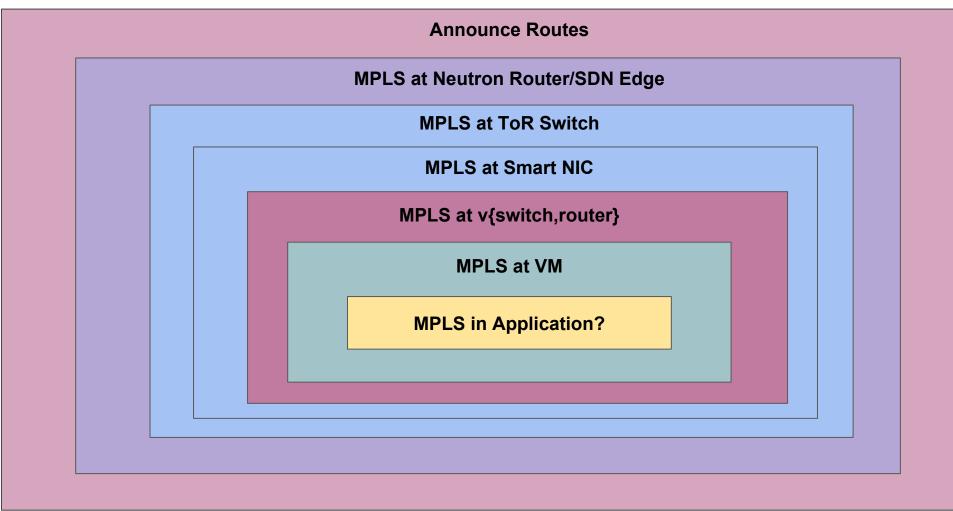

- 1. Do nothing Standard use of OpenStack
 - a. Floating IPs
 - b. VLAN based, admin controlled provider networks
- 2. Neutron Dynamic Routing
- 3. Neutron BGP-VPN / BagPipe
- 4. Future Neutron to Neutron Interconnection, others
- 5. SDN
 - a. Tungsten Fabric
 - b. OpenDaylight
 - c. Other...

WHERE DOES MPLS LABELS GET APPLIED?

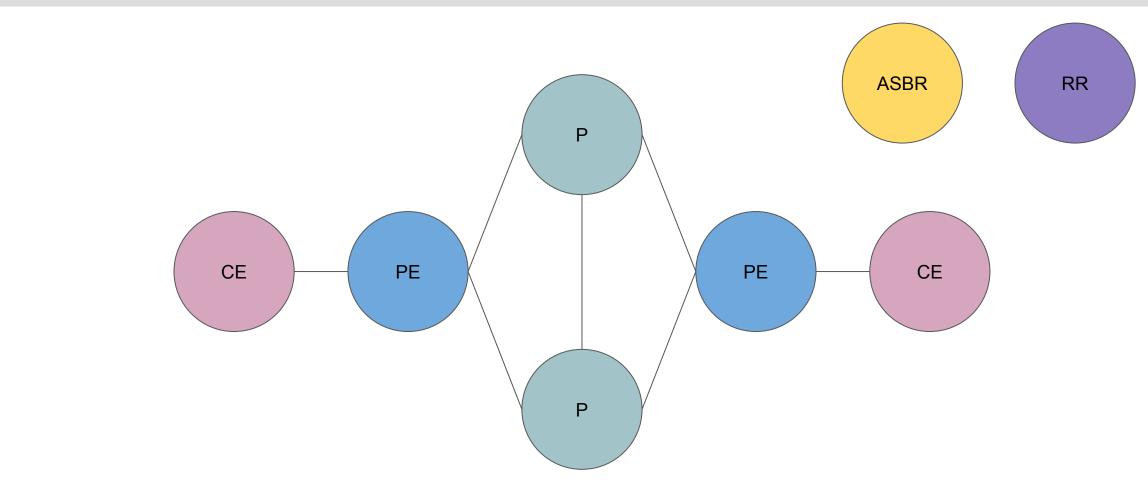

No Integration or Static

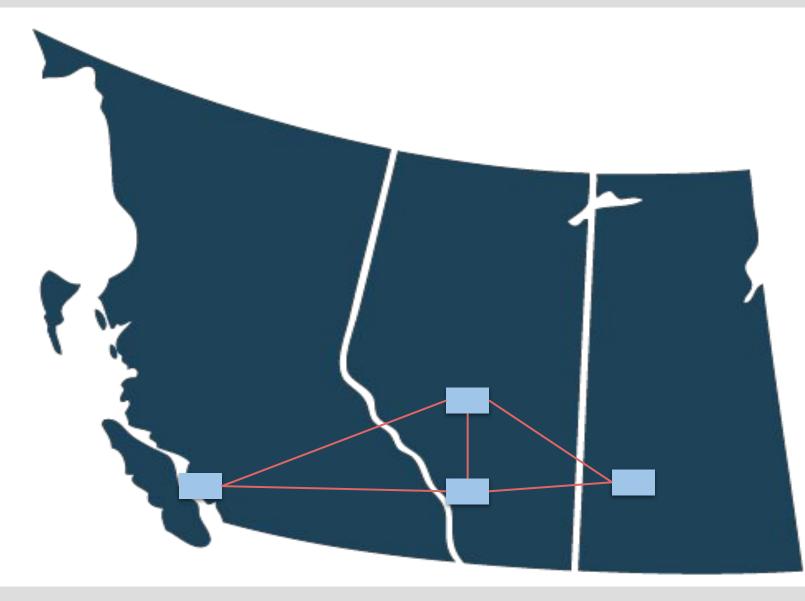

- "Just enough" MPLS to run our lab
- Based on <u>Simple Juniper MPLS Core with L3VPN blog post</u>
 - 2 provider routers
 - 2 provider edge routers
 - 2 customer edge routers
- OpenStack clouds connected at various points
- Meant to simulate a geographically distributed MPLS network
- But not 100% replicate a Service Provider network
- Added latency to interfaces with tc to simulate large distances
- Completely automated using Ansible, Netconf

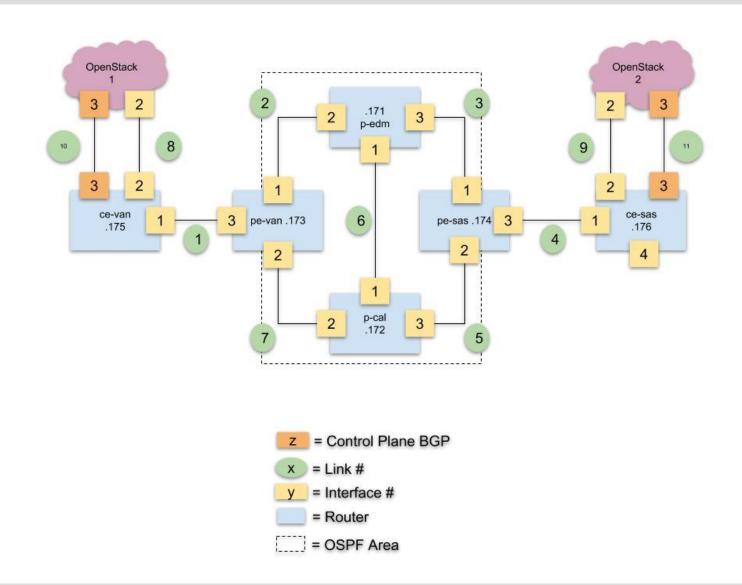

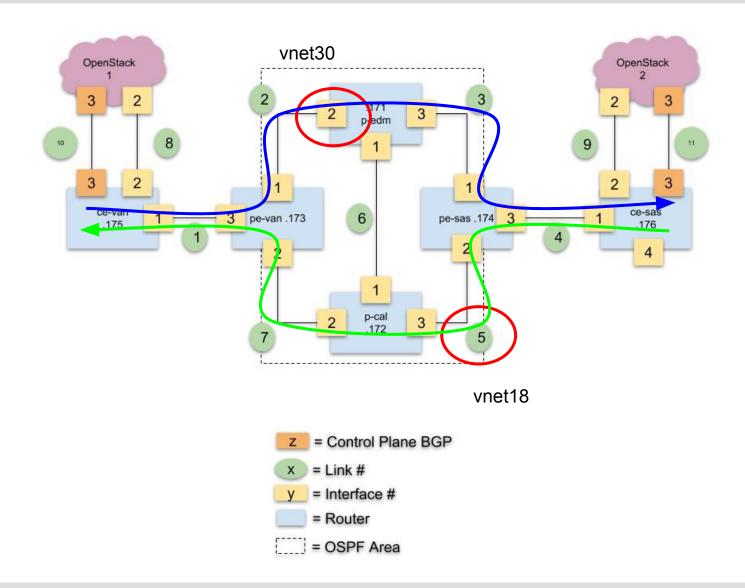

DEMO

| A bytes from 6.0.6.6: (cmp_seq=10 ttl=6: time=2.700 ms 4 bytes from 6.6.6.6: (cmp_seq=11 ttl=6: time=2.579 ms 4 bytes from 6.6.6.6: (cmp_seq=13 ttl=6: time=2.523 ms 4 bytes from 6.6.6.6: (cmp_seq=13 ttl=6: time=2.523 ms 4 bytes from 6.6.6.6: (cmp_seq=13 ttl=6: time=2.523 ms 4 bytes from 6.6.6.6: (cmp_seq=17 ttl=6: time=2.523 ms 4 bytes from 6.6.6.6: (cmp_seq=17 ttl=6: time=2.523 ms 4 bytes from 6.6.6.6: (cmp_seq=17 ttl=6: time=2.527 ms 4 bytes from 6.6.6.6: (cmp_seq=18 ttl=6: time=2.507 ms 4 bytes from 6.6.6.6: (cmp_seq=16: ttl=6: time=2.507 ms 5 (tabl 300016: exp 0, ttl=3: (tabl 20072; exp 0, [3]; ttl=6:] P tel.3.5.1 = 6.4.6.6: [CMP etto request, 10 13649; seq 12; length 64 PIS (tabl 300016: exp 0, ttl=3: (tabl 20072; exp 0, [3]; ttl=6:] P tel.3.5.1 = 6.4.6.6: [CMP etto request, 10 13649; seq 12; length 64 PIS (tabl 300016: exp 0, ttl=3: (tabl 20072; exp 0, [3]; ttl=6:] P tel.3.5.1 = 6.4.6.6: [CMP etto request, 10 13649; seq 14; length 64 PIS (tabl 300016; exp 0, ttl=3: (tabl 20072; exp 0, [3]; ttl=6:] P tel.3.5.1 = 6.4.6.6: [CMP etto request, 10 13649; seq | | | | |

NEUTRON BGP DYNAMIC ROUTING

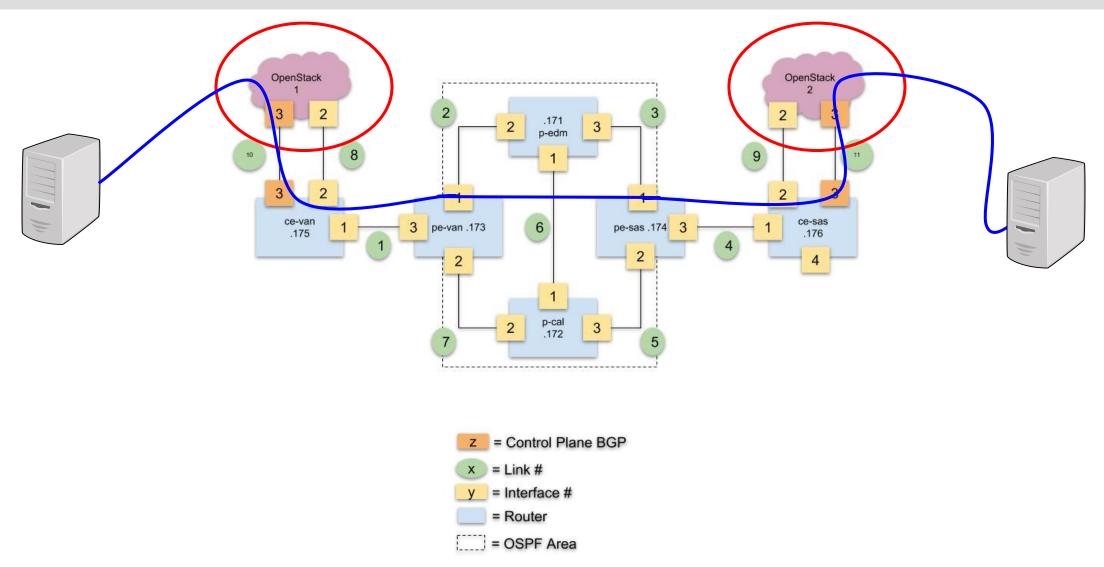

- Want ingress L3 access to tenant VXLANs
 - Next hop for inbound is not known by rest of infrastructure
- If we do static routing, all kinds of manual intervention required
- How to automate access to tenant networks and participate in a larger network?

- OpenStack deployments run Neutron Dynamic Routing
 - Basically Neutron gets a BGP speaker
- OpenStack announces routes to CE router, CE router peers with PE router
 - Or could be CE router...
- Value is that self service networks are accessible at L3 via Neutron routers immediately and automatically
- Clouds can be given particular networks they are allowed to announce routes in
- Not the same as BGP-VPN (will cover that later)
- Not directly integrated with MPLS (not meant to be at this time)

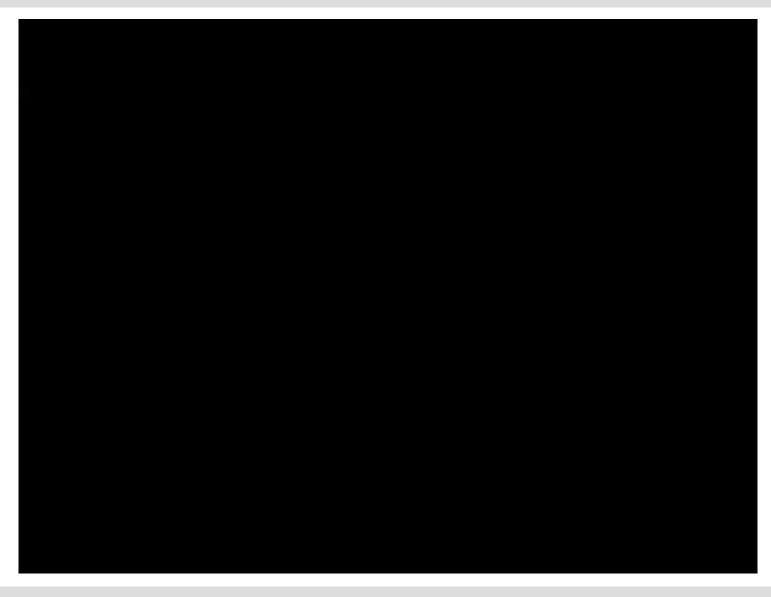

NEUTRON BGP DYNAMIC ROUTING

NEUTRON BGP DYNAMIC ROUTING

NEUTRON BGPVPN INTERCONNECTION

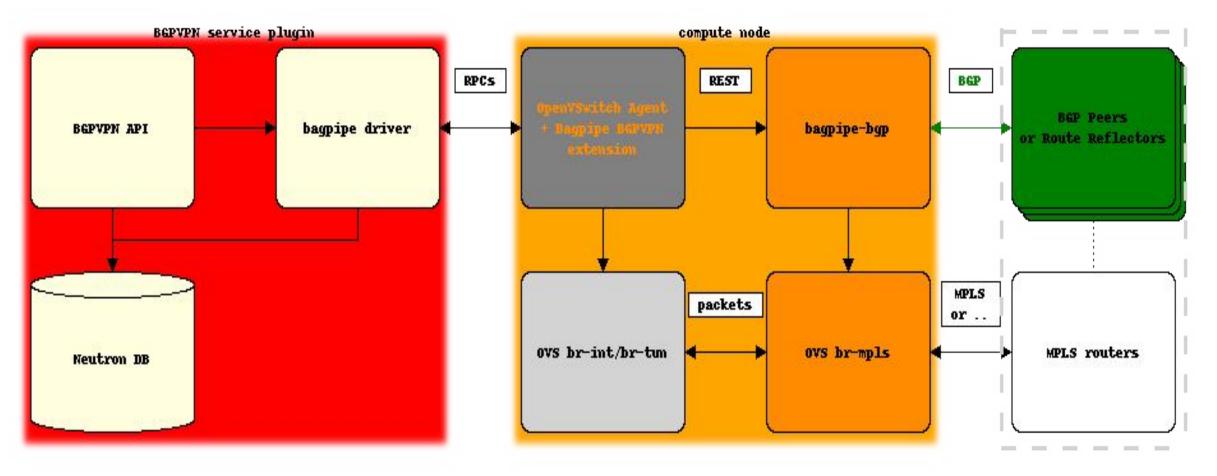

- "the goal...is to make it possible to create the interconnect we need when the technology of BGP-based VPNs is <u>already used outside</u> an OpenStack cloud."
- "... the PE and VRF functions are implemented on compute nodes and the VMs are acting as CEs. This PE function will BGP-peer with edge IP/MPLS routers, BGP Route Reflectors or other PEs."
- "Bagpipe BGP...could also be instantiated in network nodes, at the l3agent level, with a BGP speaker on each l3agent; router namespaces could then be considered as CEs."

- **BGP VPN Interconnection Overview**

NEUTRON BGPVPN INTERCONNECTION

* Diagram borrowed from Openstack.org

NEUTRON TO NEUTRON INTERCONNECT

С

N2N INTERCONNECT

How to interconnect two OpenStack deployments ? (..... two or more OpenStack ? two regions ?)

Source: https://www.openstack.org/assets/presentation-media/20171107-OpenStackSummit-Sydney-NeutronNeutronX-02.pdf

- Neutron to Neutron Interconnect Spec
 - <u>http://logs.openstack.org/26/545826/15/check/build-openstack-sphinx-docs/1107e34/</u> <u>html/specs/rocky/neutron-inter.html</u>
- With existing tools we can connect routers and networks to existing BGP VPNs, but requires some external orchestration and configuration
- What if we want to connect isolated networks on-demand?
 - \circ lsolated
 - Private addressing
 - \circ Not using encrypted VPNs
- Neutron to Neutron Interconnect Spec

SDN RELATED SOLUTIONS

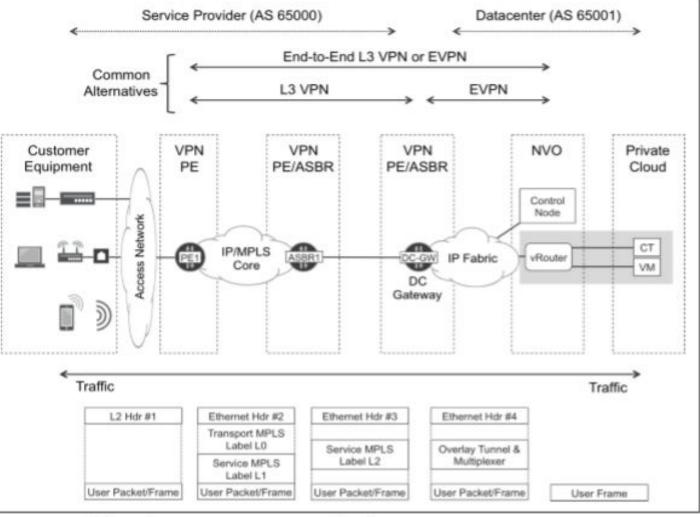

- Many different SDN solutions
- SDN by definition means networking is implemented in software, and thus architectural and implementation decisions are made in that software
- To discuss all solutions would be to discuss...many implementations
- Examples could be:
 - Tungsten Fabric
 - OpenDaylight
 - Calico
 - Many others...
- If Neutron does not have a particular API available, then must use SDN's API

TUNGSTEN FABRIC (AKA OPENCONTRAIL)

- TF heavily leverages MPLS and XMPP and BGP
- "VMs and containers are like CEs"
- "vRouters are like PEs"
- "Like ASBR1, the data center gateway is an **Option B** Autonomous System Border Router (ASBR)"

Source: MPLS in the SDN Era

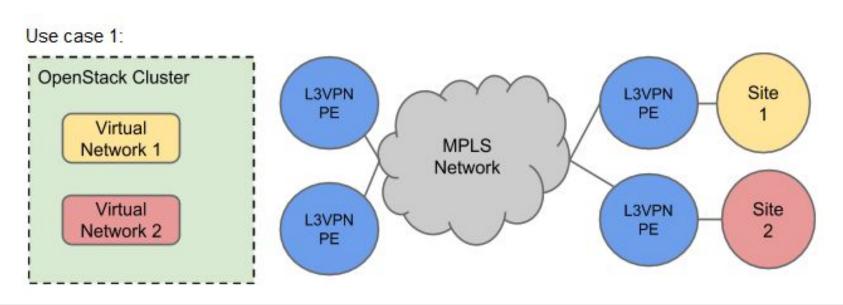

Figure 11-2. Subscriber access to a private cloud

OTHER NEUTRON SPECS AND PROJECTS

- Spec "Connect Neutron Virtual Network with Existing VPN with routes being dynamically exchanged via BGP. This scenario assumes the use of inter-AS option B) between the OpenStack cluster and the external BGP/MPLS L3VPN network." - <u>Neutron BGP MPLS</u>
- RFC 4364 (same as neutron-bgpvpn)

• Spec - Neutron Edge VPN

- "This blueprint defines APIs to provision edge VPNs for MPLS VPN use case. MPLS enables the deployment of L2 and L3 VPNs between data centers, with QoS guarantees, to provide inter-datacenter connectivity. With these capabilities, we can achieve WAN orchestration where tenant VMs located in different datacenters can communicate transparently over an MPLS network." <u>Neutron BGP MPLS</u>
- Project Tricircle
 - "The purpose of the Tricircle project is to provide networking automation across Neutron servers in multi-region OpenStack clouds deployment."

LESSONS LEARNED

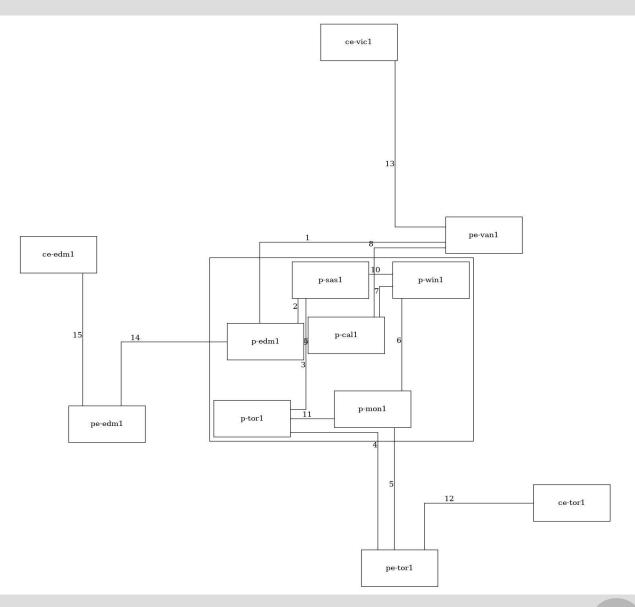

- vSRX can be up to 30 minutes before completely available
 - Could be easy wins to reduce time; haven't investigated fully
- Getting all in one deployments of DevStack, Tungsten Fabric, etc, not easy to maintain over time
- Automating everything allows us to move to new hardware easily without having to do manual work, rename things, deploy different topologies, etc
- Quite a few todos:
 - Schedule networks instead of hardcoding via Ansible inventory
 - Move to YANG

LESSONS LEARNED - AUTOMATION

- Link based inventory -- First we define all links in YAML, then custom Ansible inventory is based off of that
- Also working on automatic generation of network diagrams based on links and pygraphiz

- Had some issues keeping bgp connection alive, occasionally had to recreate speakers
 - If the bgp dragent was restarted, bgp connectivity was lost
 - Not much investigation done here yet, but are wondering how to keep this highly available outside of a PoC
- Still need some manual architecture work done in terms of what networks clouds are allowed to announce
 - This would be determined by a network ops team outside of OpenStack
 - Eg. specified subnet pools: openstack-1: 10.0.1.0/16, openstack-2: 10.0.2.0/16

- Based on iBGP
- Major use case is for connecting Neutron routers and networks with existing VPNs
- When connecting networks/ports, each compute node essentially be a PE router
- Need to test multiple compute based infrastructure; deployments were "all in one" instances

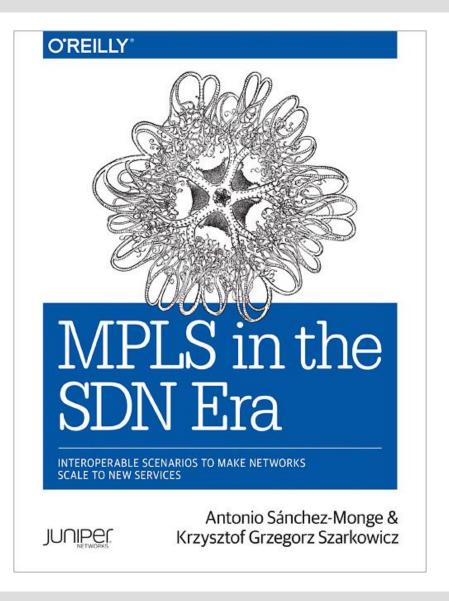

END MATTER

С

- "MPLS in the SDN Era" is quite an astounding piece of work
 - Antonio Sanchez-Monge and Krzysztof Grzergorz Szarkowicz

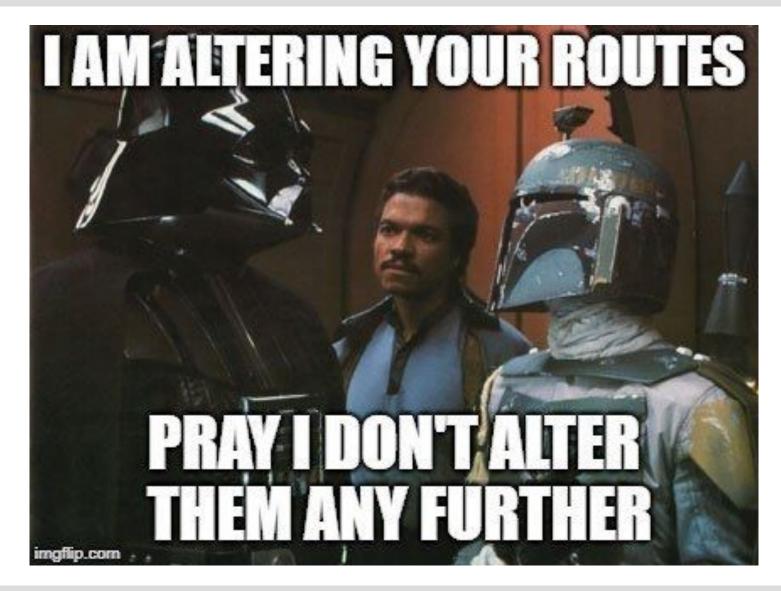

- Networking has a long history of standards and interop; lots to learn
- CE, P, and PE router definitions may not be granular enough for MPLS in NFV/SDN era
- MPLS integration is possible at many points
- Inter-AS vs single operator
- Options for interconnecting multiple OpenStack clouds are currently few
- Stepping outside of Neutron APIs is a slippery slope for interop

- Challenging to keep a dev lab up and running (complex systems moving quickly)
- Intersection of high-end networking and OpenStack: large technical domain, especially when including SDN
- Ultimately, network integration of multiple clouds is the act of automating (ie. providing OpenStack APIs for) existing, well known technologies like MPLS and BGP VPNs

- Thanks to:
 - Thomas Morin for help with BGP-VPN/Bagpipe
